

DreamCoder with a PostgreSQL Database and WIN1253

Posted by mail-question - 2009/07/02 08:07

Dear Sirs,

I am trying to use DreamCoder with a PostgreSQL Database which is encoded in WIN1253 (Greek Windows Encoding) and I DO NOT want to change the encoding. ALL column, index and relation names are in Greek characters. However, in the connection to database dialog the encoding options DO NOT include WIN1253. So I am forced to select other encoding to work with my database, which either does not show greek characters or does not show column and index and relation names. As you understand under these circumstances I can not use your software AT ALL !! DO you intend to include WIN1253 encoding in a very near update of the software ?

Sincerely yours, Nikolaos Papageorgiou

hi,

The problem was already fixed in the new DreamCoder for PostgreSQL ver 2.1.

Sincerely,

Mentat Technologies
